Product specifics

GSE Air'System combined with the GSE Integration systems generates an hybrid photovoltaic that allows solar energy to be transformed into: Electricity production for self-consumption or injection into the grid, with improved efficiency thanks to a better panels ventilation; Heat production through the pre-heating of incoming air, depending on sunlight conditions, weather conditions and the home; Summer night cooling of homes with over-ventilation.

All components of the heat producing photovoltaic GSE Air'System are made in France and offer compliance with European and French standards needed for installation (SMABTP Certified, ETN, CSTB Certified, RSA)
