Product specifics

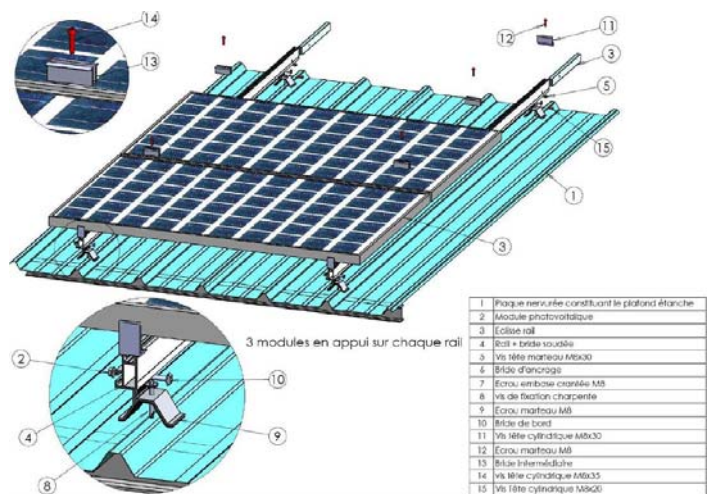

The S-TE Fixea SIT-m is an in-roof building integrated structure, certified by French CSTB (ATEc), for commercial and farm buildings. Due to its flexibility in terms of installation, it can adapt to each project and roof configurations.

It may cover partially or totally the surface of new or already existing roofs. It is suitable for roof slopes from 6° to 65°. Watertightness is provided by ribbed overlapping panels. Ventilation is ensured between the bottom of the modules and the metal sheet panels. There is also the possibility of customization.

Note: before installation, the customer should contact the company to ensure compatibility of modules with the fastening system.
